

## Pass Statement

You can use pass statement in place where you don't need to write any code to execute or comment on that line.

### Syntax:

```
pass
```

### Example:

```
var = int(input('Enter 10 or 12 u will get only output if you type 12'))
if var != 10:
    pass
else:
    print('You entered 12')
```

### Output:

```
Enter 10 or 12 u will get only output if you type 12 10
Enter 10 or 12 u will get only output if you type 12 12
You entered 12
```

### Explanation:

This program will print output only if you give input as 12.

You can write pass statement while writing a big program and execute to see whether you are getting any error or not.
